

`std::false_type`

`std::true_type`

`detail::is_json_iterator  
_of< BasicJsonType, typename  
BasicJsonType::iterator >`

```
graph BT; A["detail::is_json_iterator_of< BasicJsonType, typename BasicJsonType::iterator >"] --> B["std::false_type"]; A --> C["std::true_type"];
```

The diagram illustrates a C++ type hierarchy. At the bottom is a gray box containing the code `detail::is_json_iterator_of< BasicJsonType, typename BasicJsonType::iterator >`. Two blue arrows point upwards from this box to two white boxes at the top. The left white box contains `std::false_type` and the right white box contains `std::true_type`. This indicates that the custom iterator type inherits from `std::false_type` and `std::true_type`.
